

# Lab Task

A university wants to store student registration details in a database instead of keeping paper records. At this stage, the system only needs to insert student data into the database and display a success message after registration.

## Task Requirements

### Database Requirements

Create a database named `university_db` with a table `students` having:

- `id` (INT, Primary Key, Auto Increment)
  - `name` (VARCHAR)
  - `email` (VARCHAR)
  - `age` (INT)
  - `department` (VARCHAR)
- 

### Application Requirements

- Create a student registration form
- Connect PHP with MySQL
- Insert form data into the database
- Display *Registration Successful* after insertion
